

NetSim Multi-Parameter Sweep Program

Software: NetSim v13.1 (64 bit), [DOT NET CORE SDK 3.1](#), [Python 3.7.4](#)

Project Download Link:

https://github.com/NetSim-TETCOS/Multi-Parameter_Sweeper_v13.1/archive/refs/heads/main.zip

Introduction

When users want to *sweep* one or more parameters, they change their values between simulation runs, and compare and analyse the performance metrics from each run. NetSim multi-parameter sweeper enables users to automate the sweep process.

Consider an example, where a user wishes to create and simulate a network scenario for all possible values of one or more parameters in combination and analyse a set of performance metrics across the simulation runs. This is extremely time consuming to do manually using the NetSim GUI.

The multi-parameter sweep program enables users to automate the sweep process across multiple input parameters, simulate each run, save each result, and compare specific output metrics via a spreadsheet software like MS Excel.

The sweep program runs NetSim via its CLI interface.

File Organization

The project directory consists of several binaries which are responsible for different tasks during a multi-parameter sweep:

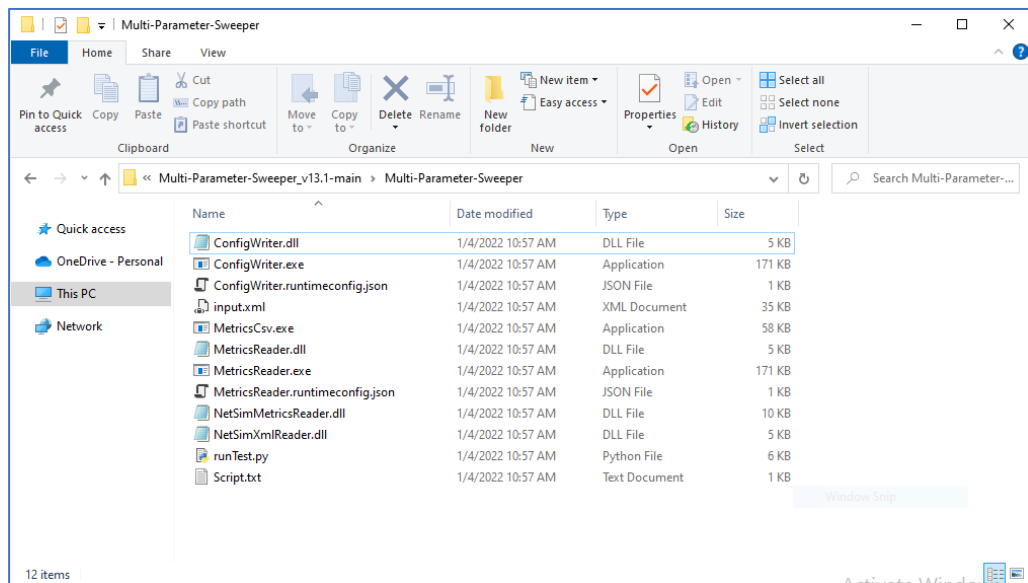

Figure 1: project directory consists of several binaries

1. **input.xml**: This file contains the base NetSim network configuration that is to be simulated. This file is created by copy pasting the Configuration.netsim file that can be obtained by saving a network configuration in NetSim and renaming it to input.xml.

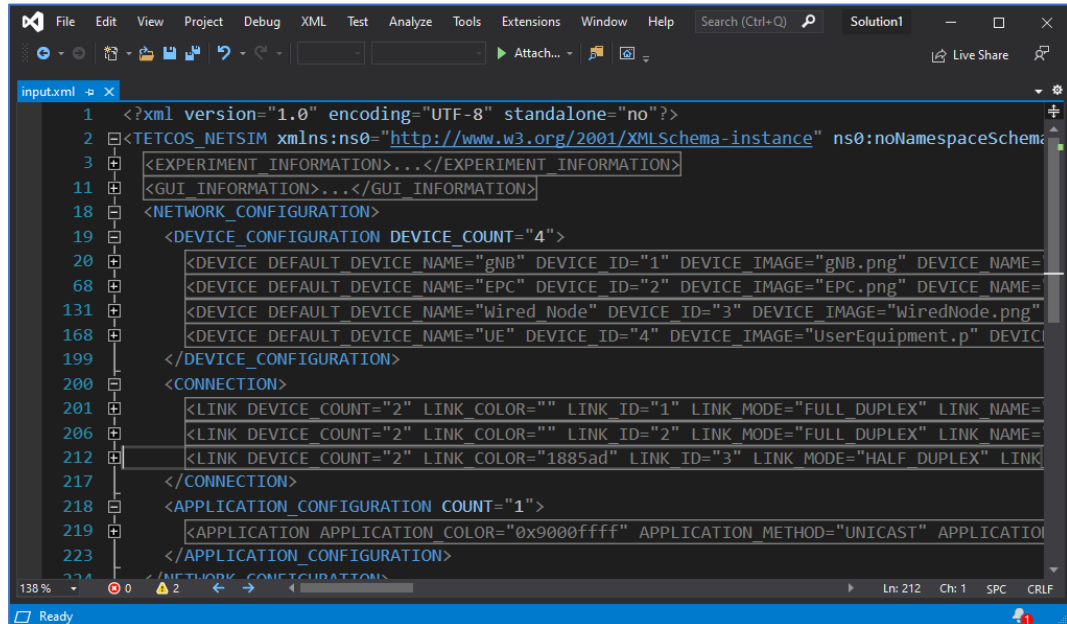

Figure 2: NetSim input Configuration.netsim file

- The values of parameters which are to be varied during each simulation run needs to be specified as {0}, {1}, {2}, etc. respectively.
- For Example, if the X and Y coordinates of a device is to be varied the values can be modified in the input.xml file as shown below:

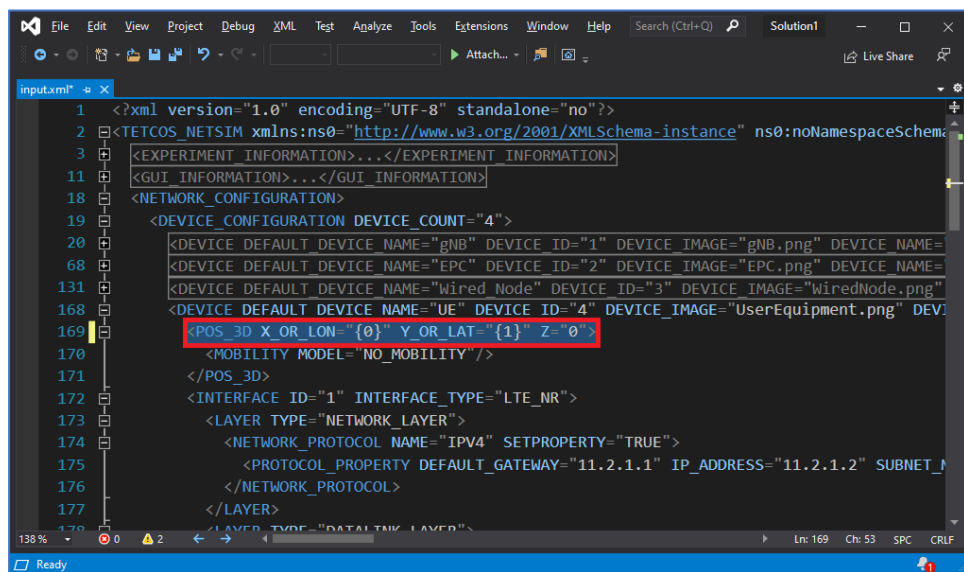

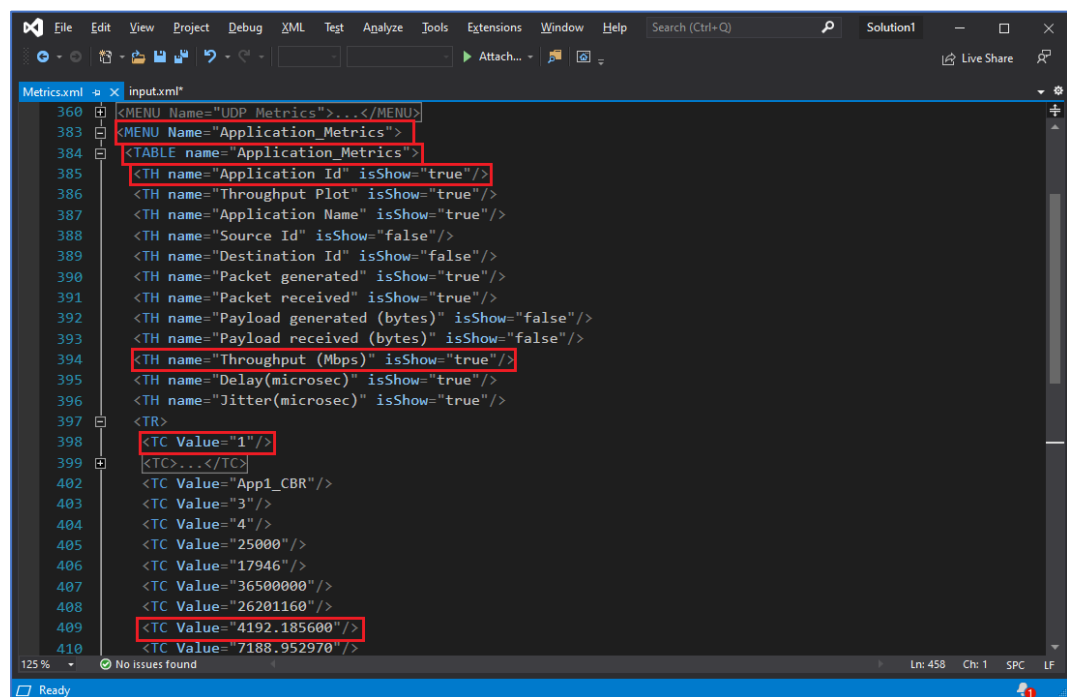

Figure 3: Modify X and Y coordinates in input input.xml file

2. **Script.txt:** This file should be updated with the parameter from the output metrics of NetSim that is to be logged at the end of each simulation run for the purpose of analysis.

At the end of every simulation, NetSim generates a Metrics.xml file which contain the performance metrics written in a specific format based on which it is loaded in the results dashboard.

Each Metric is part of a results table which can be accessed using a menu in the results dashboard.

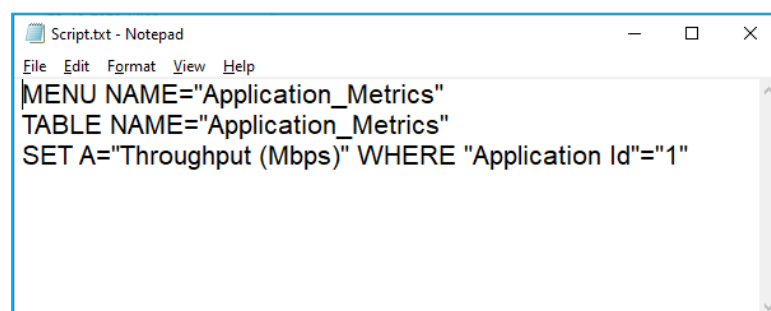

A NetSim Metrics.xml file is shown below:

```
360 <MENU Name="UDP_Metrics">...</MENU>
383 <MENU Name="Application_Metrics">
384 <TABLE name="Application_Metrics">
385 <TH name="Application Id" isShow="true"/>
386 <TH name="Throughput Plot" isShow="true"/>
387 <TH name="Application Name" isShow="true"/>
388 <TH name="Source Id" isShow="false"/>
389 <TH name="Destination Id" isShow="false"/>
390 <TH name="Packet generated" isShow="true"/>
391 <TH name="Packet received" isShow="true"/>
392 <TH name="Payload generated (bytes)" isShow="false"/>
393 <TH name="Payload received (bytes)" isShow="false"/>
394 <TH name="Throughput (Mbps)" isShow="true"/>
395 <TH name="Delay(microsec)" isShow="true"/>
396 <TH name="Jitter(microsec)" isShow="true"/>
397 <TR>
398 <TC Value="1"/>
399 <TC>...</TC>
402 <TC Value="App1_CBR"/>
403 <TC Value="3"/>
404 <TC Value="4"/>
405 <TC Value="25000"/>
406 <TC Value="17946"/>
407 <TC Value="36500000"/>
408 <TC Value="26201160"/>
409 <TC Value="4192.185600"/>
410 <TC Value="7188.952970"/>
```

Figure 4: NetSim output Metrics.xml file

For Example, if the application throughput is to be logged for each simulation run then the script file can be updated as shown below:

```
Script.txt - Notepad
File Edit Format View Help
MENU NAME="Application_Metrics"
TABLE NAME="Application_Metrics"
SET A="Throughput (Mbps)" WHERE "Application Id"="1"
```

Figure 5: The application throughput is to be logged for each simulation modified in Script.txt

3. **ConfigWriter.exe**: This executable takes one or more command line arguments as input and generated Configuration.netsim file by replacing the arguments in place of the variable parameters specified in the input.xml file.

If there are two variable parameters specified in the input.xml file ({0} and {1}) then two arguments need to be passed while calling ConfigWriter.exe.

4. **MetricsCSV.exe**: This executable is used to convert the Metrics.xml file present in the output folder into a comma separated file, MetricsPrint.csv.

5. **MetricsReader.exe**: This executable is responsible for reading the output parameter from the Metrics.xml file generated after each simulation and logging it to the results file.

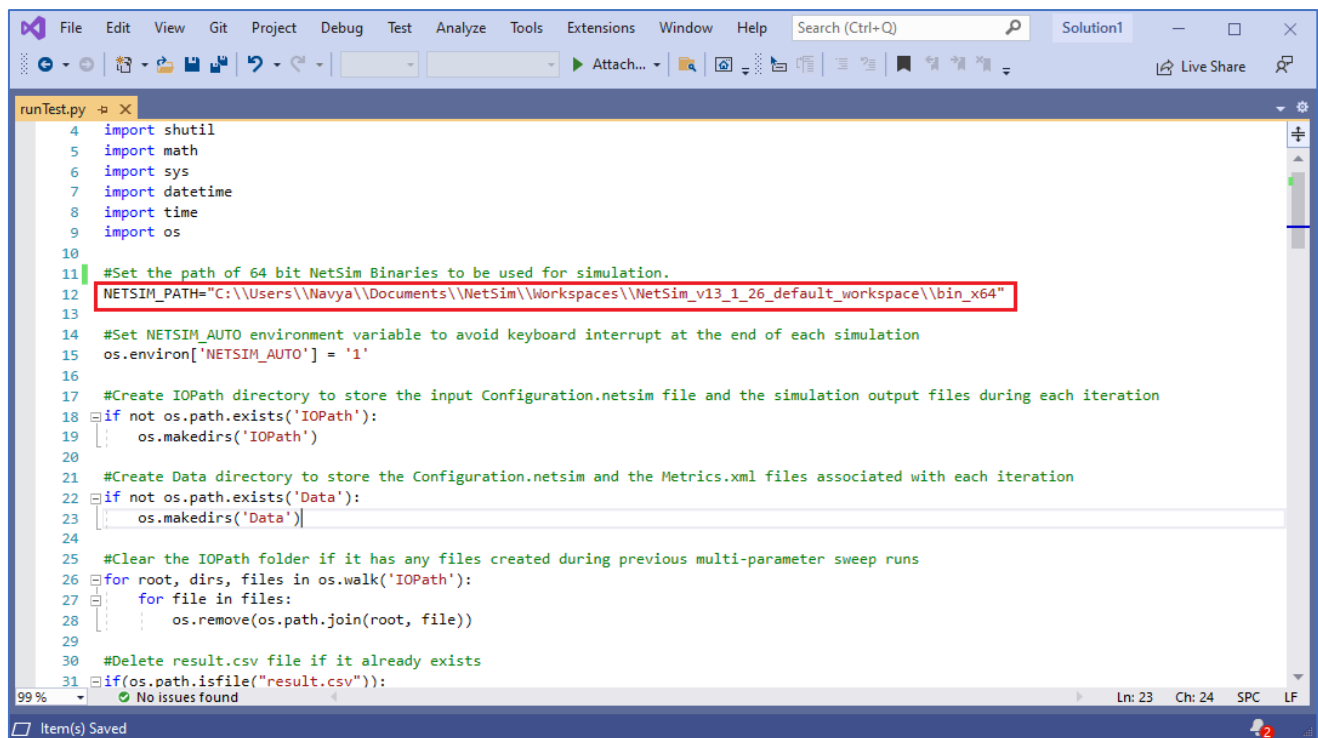

It uses the Script.txt file to determine which parameter to read from the Metrics file.

If multiple parameters are to be read and logged, then the MetricsReader.exe can be called multiple times with Script.txt file having information about the parameter to be read each time.

6. **Supporting DLL's**: Some the supporting files such as ConfigWriter.dll, MetricsReader.dll, NetSimMetricsReader.dll, NetSimXmlReader.dll, etc. which are present in the project folder are used by other executable such as ConfigWriter.exe and MetricsReader.exe for various purposes during a multi-parameter sweep.

7. **runTest.py** uses python programming language which is less complex and offers more flexibility as the number of input and output parameters increases.

- Users can also write the script to run the multi-parameter sweep process in a preferred programming language as per the convenience.
- The script can be configured to run multiple simulation iterations based on the number of parameters to be varied and the range of values of each parameter.
- NETSIM_PATH variable can be set to the path of NetSim 64-bit binaries in the install directory or workspace which is to be used to run Simulations.

```
runTest.py
4 import shutil
5 import math
6 import sys
7 import datetime
8 import time
9 import os
10
11 #Set the path of 64 bit NetSim Binaries to be used for simulation.
12 NETSIM_PATH="C:\\Users\\Navya\\Documents\\NetSim\\Workspaces\\NetSim_v13_1_26_default_workspace\\bin_x64"
13
14 #Set NETSIM_AUTO environment variable to avoid keyboard interrupt at the end of each simulation
15 os.environ['NETSIM_AUTO'] = '1'
16
17 #Create IOPATH directory to store the input Configuration.netsim file and the simulation output files during each iteration
18 if not os.path.exists('IOPATH'):
19     os.makedirs('IOPATH')
20
21 #Create Data directory to store the Configuration.netsim and the Metrics.xml files associated with each iteration
22 if not os.path.exists('Data'):
23     os.makedirs('Data')
24
25 #Clear the IOPATH folder if it has any files created during previous multi-parameter sweep runs
26 for root, dirs, files in os.walk('IOPATH'):
27     for file in files:
28         os.remove(os.path.join(root, file))
29
30 #Delete result.csv file if it already exists
31 if os.path.isfile("result.csv")):
```

Figure 6: User need to set NetSim Path based on 64-bit

For example, for 64bit the respective paths can be set as follows:

64-bit:

NETSIM_PATH="C:\\Users\\Navya\\Documents\\NetSim\\Workspaces\\NetSim_v13_1_26_default_workspace\\bin_x64"

- <license information> - License server details or the path of license file in case of node locked or cloud licenses

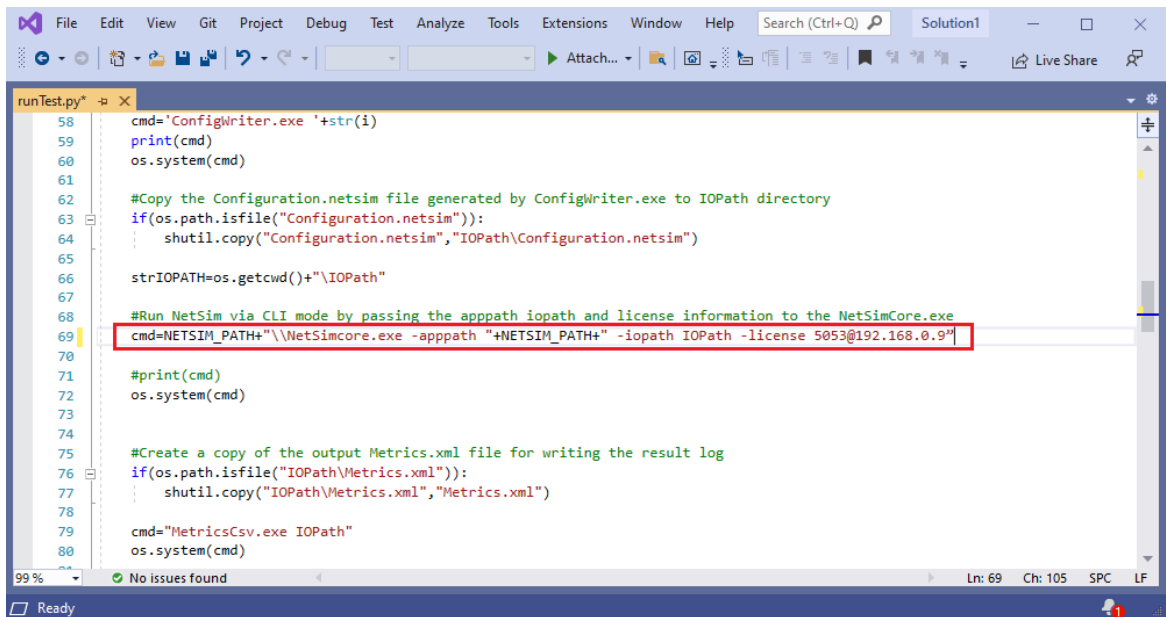

Figure 7: User need to set NetSim Path based on 64-bit and license file server information

For Example, the command for server-based license and node-locked/ cloud licenses can be entered as follows:

Server based license (<port no>@<server ip address>):

```
cmd=NETSIM_PATH+"\\NetSimcore.exe -apppath "+NETSIM_PATH+" -iopath IOPath -license 5053@192.168.0.9"
```

Node Locked or Cloud licenses (path of license file):

```
cmd=NETSIM_PATH+"\\NetSimcore.exe -apppath "+NETSIM_PATH+" -iopath IOPath -license "+\\"C:\\Program Files\\NetSim\\Standard_v13_1\\bin\\""
```

- The MetricsCSV.exe will convert the Metrics.xml file inside the output folder into a csv file.

```

73 #print(cmd)
74 os.system(cmd)]
75
76
77 #Create a copy of the output Metrics.xml file for writing the result log
78 if(os.path.isfile("IOPath\Metrics.xml")):
79     shutil.copy("IOPath\Metrics.xml","Metrics.xml")
80
81 cmd="MetricsCsv.exe IOPath"
82 os.system(cmd)
83
84 #Number of Script files i.e Number of Output parameters to be read from Metrics.xml
85 #If only one output parameter is to be read only one Script text file with name Script.txt to be provided
86 #If more than one output parameter is to be read, multiple Script text file with name Script1.txt, Script2.txt,...
87 #...,Scriptn.txt to be provided
88 OUTPUT_PARAM_COUNT=1;
89
90 if(os.path.isfile("Metrics.xml")):
91     #Write the value of the variable parameters in the current iteration to the result log
92     csvfile = open("result.csv", 'a')
93     csvfile.write('\n'+str(i)+'\n')
94     csvfile.close()
95
96 if(OUTPUT_PARAM_COUNT==1):
97     #Call the MetricsReader.exe passing the name of the output log file for updating the log based on script.txt
98     os.system("MetricsReader.exe result.csv")

```

Figure 8: MetricsPrint.csv file will be created in the IOPath and then copied into the respective output folder

8. Multi-Parameter Sweeping process is started by opening command prompt in the directory of the Multi-Parameter-Sweeping project and starting the python script as shown below:

```

Select C:\Windows\System32\cmd.exe
Microsoft Windows [Version 10.0.19043.1415]
(c) Microsoft Corporation. All rights reserved.

C:\Users\Navya\Desktop\Multi-Parameter-Sweeper_v13.1-main\Multi-Parameter-Sweeper_v13.1-main\Multi-Parameter-Sweeper>python runTest.py

```

Figure 9: Running python script using cmd prompt

9. This starts the Multi-Parameter-Sweeping process which runs NetSim simulations iteratively for different values of Y parameter of UE.
10. At the end of the process the Multi-Parameter-Sweeping folder will have the following file and folders created:

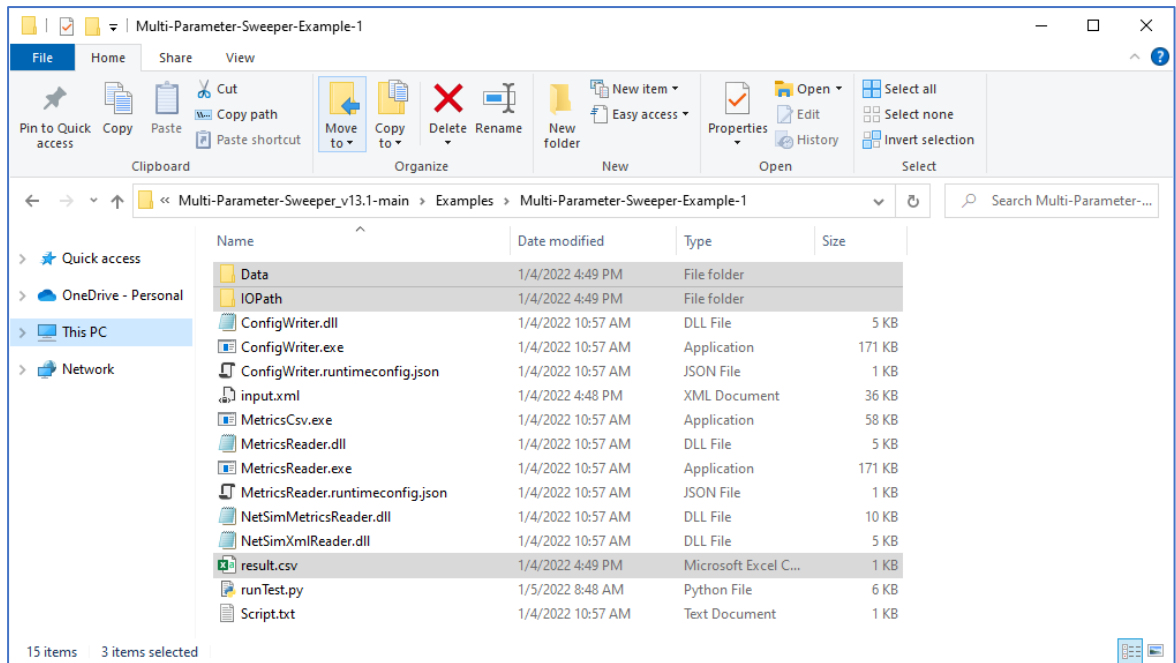

Figure 10: After Simulation Multi-Parameter-Sweeping folder contains output files like result.scv, Data etc

- **Data:** Contains multiple folders created based on date and time of simulation inside which multiple output folders corresponding to each simulation run, with its name including the value of the parameters in that iteration gets created.

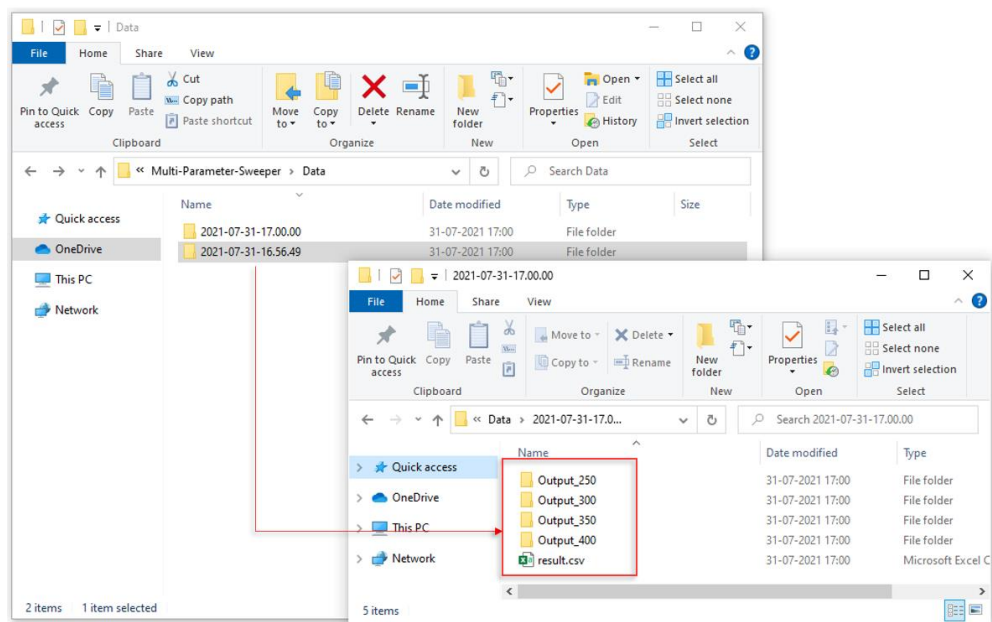

Figure 11: Based on values in the iteration, Output folder gets created in the Data directory inside a folder named as per date and time of simulation along with a copy of result.csv file.

- Each folder contains the all the output files associated with the simulation run.

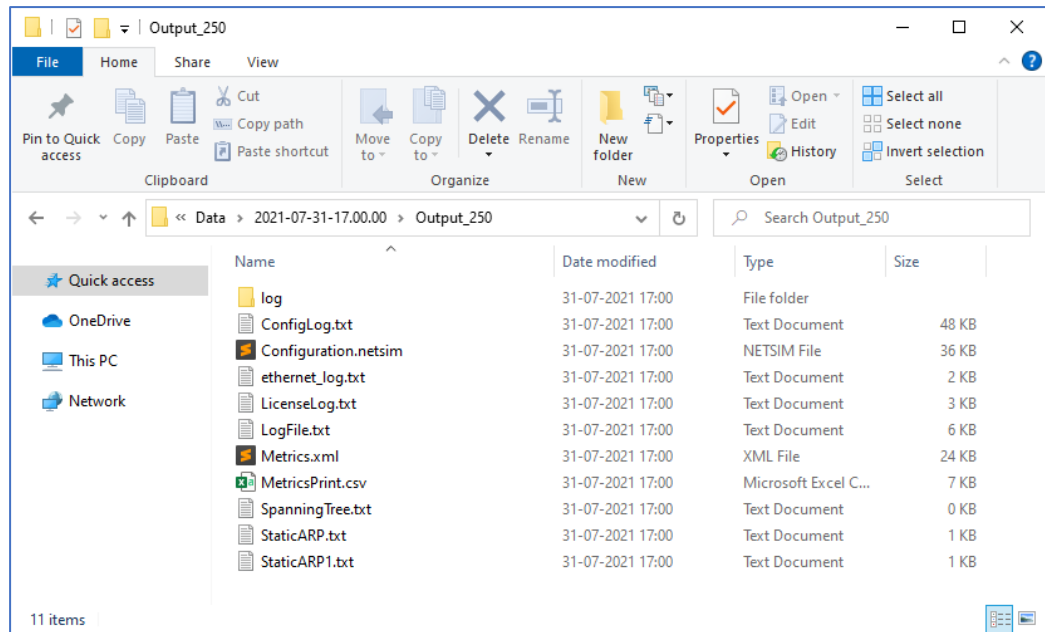

Figure 12: Each folder contains all the output files and the Metrics.xml file converted to MetricsPrint.csv file

Note: User should keep a back-up of the data folder to avoid data loss.

- **IO Path:** Used for storing the Configuration.netsim file and the simulation files generated during each simulation run.
- **Result.csv:** This is the output log which contains the parameter varied during each simulation run and the output parameter associated with each run. The result.csv file will also be copied into the output folder after each simulation.

	A	B	C	D	E
1	Y	THROUGHPUT(Mbps)			
2	250	4192.1856			
3	300	4192.1856			
4	350	2278.5344			
5	400	1352.7776			
6					
7					
8					

Figure 13: Iterated value and Throughput obtained listed in result.csv

Example 1: Modifying a single input parameter and logging a single output parameter

Consider the following network 5G network scenario in NetSim, comprising of a Wired Node, Router, gNB and a UE.

Figure 14: Network Topology

The network configuration has the initial distance between the gNB and UE as 50 meters with the gNB located at (500,0) and UE located at (500,500).

Multi-Parameter Sweeper is configured to run simulations for different distance between the gNB and UE by varying the UE Y coordinate value from 500 to 2000 in steps of 500 meters.

The network scenario is saved and the content of the Configuration.netsim file is copied to the Multi-Parameter-Sweeper directory and renamed as input.xml.

Refer to the Example 1 directory which is part of the project folder (Multi-Parameter-Sweeper_v13.1\Examples\Multi-Parameter-Sweeper-Example-1)

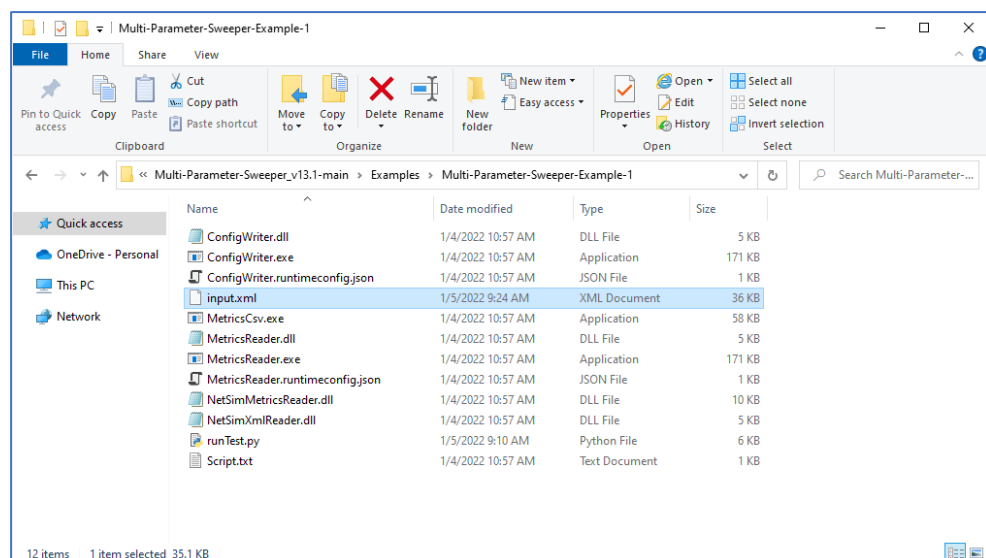

Figure 15: Renamed Configuration.netsim to input.xml and pasted in Multi-Parameter-Sweeper directory

1. The value of the Y coordinate of UE that is to be modified during each simulation run is updated (“{0}”) in the configuration file as shown below:

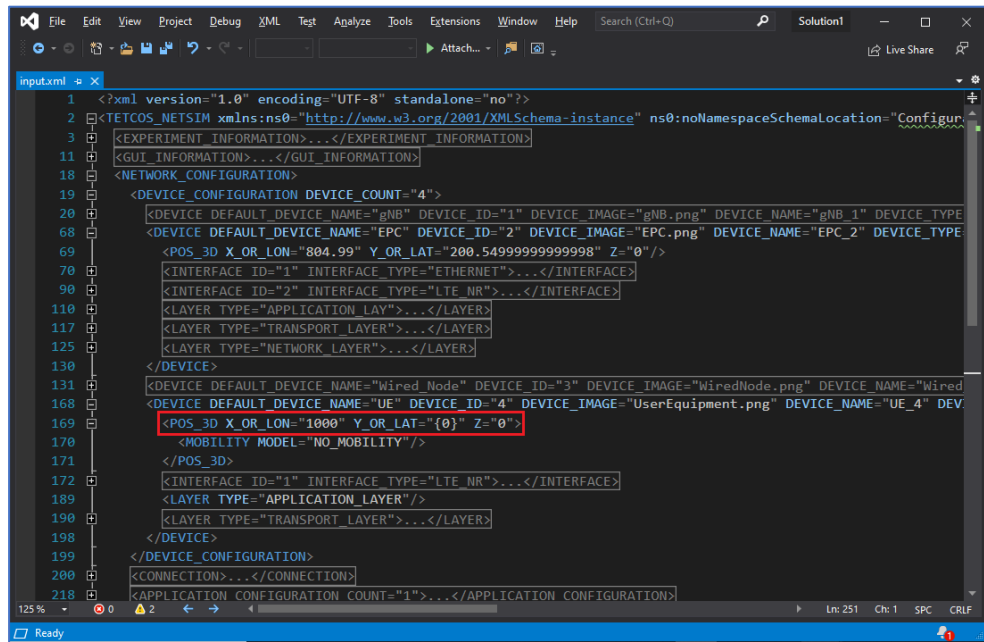

Figure 16: Modified Y coordinate of UE in input.xml

2. The Script.txt file is updated with the details of the output parameter to be read from the Metrics.xml file and added to the result csv log file. In this case the Application throughput is to be logged for each simulation run.

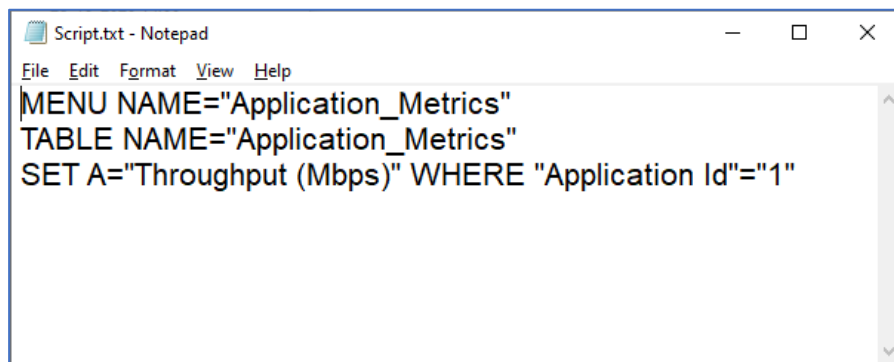

Figure 17: The application throughput is to be logged for each simulation modified in Script.txt

3. runTest.py is updated to pass the Y coordinate value during each iteration to generate Configuration file run simulation and update the result csv log.

The runTest.bat batch script modified for running simulations for different values of Y coordinates starting from 500 up to 2000 in steps of 500 is shown below:

- A result.csv file is created and added with headings Y and Throughput (Mbps).
- A MetricsPrint.csv is created inside every output folder.

- For loop is set to iteratively run simulations for values starting from 500 to 2000 in steps of 500.
- The value of the parameter Y in the current iteration is written to the result log file for analysis.
- The value of the parameter Y in the current iteration is passed as input to ConfigWriter executable to generate Configuration.netsim file for each simulation.
- NetSim simulation is run via CLI mode by passing the apppath, iopath and license server information
- Configuration file and Metrics file are copied and renamed appending the value of the parameter in the current iteration.

The runTest.py python script modified for running simulations for different values of Y coordinates starting from 500 up to 2000 in steps of 500 is shown below:

```

10
11 #Set the path of 64 bit NetSim Binaries to be used for simulation.
12 NETSIM_PATH="C:\\Users\\Wavya\\Documents\\NetSim\\Workspaces\\NetSim_v13_1_26_default_workspace\\bin_x64"
13
14 #Set NETSIM_AUTO environment variable to avoid keyboard interrupt at the end of each simulation
15 os.environ["NETSIM_AUTO"] = '1'
16
17 #Create IOPath directory to store the input Configuration.netsim file and the simulation output files during each iteration
18 if not os.path.exists('IOPath'):
19     os.makedirs('IOPath')
20
21 #Create Data directory to store the Configuration.netsim and the Metrics.xml files associated with each iteration
22 if not os.path.exists('Data'):
23     os.makedirs('Data')
24
25 #Clear the IOPath folder if it has any files created during previous multi-parameter sweep runs
26 for root, dirs, files in os.walk('IOPath'):
27     for file in files:
28         os.remove(os.path.join(root, file))
29
30 #Delete result.csv file if it already exists
31 if os.path.isfile("result.csv"):
32     os.remove("result.csv")
33
34 #create a csv file to log the output metrics for analysis
35 csvfile = open("result.csv", 'w')
36
37 #Add headings to the CSV file
38 csvfile.write('Y,THROUGHPUT(Mbps),')
39 csvfile.close()

```

Figure 18: To Create result.csv file, added with headings Y and Throughput (Mbps) and NetSim installation Path

- NETSIM_PATH variable is set to the path of NetSim 64-bit binaries in the install directory or workspace in the system.
- A result.csv file is created and added with headings Y and Throughput (Mbps).

- Multi-Parameter Sweeping process is started by opening command prompt in the directory of the Multi-Parameter-Sweeping project and starting the python script as shown below:

Figure 21: Running python script using cmd prompt

This starts the Multi-Parameter-Sweeping process which runs NetSim simulations iteratively for different values of Y parameter of UE.

At the end of the process the Multi-Parameter-Sweeping folder will have the following file and folders created:

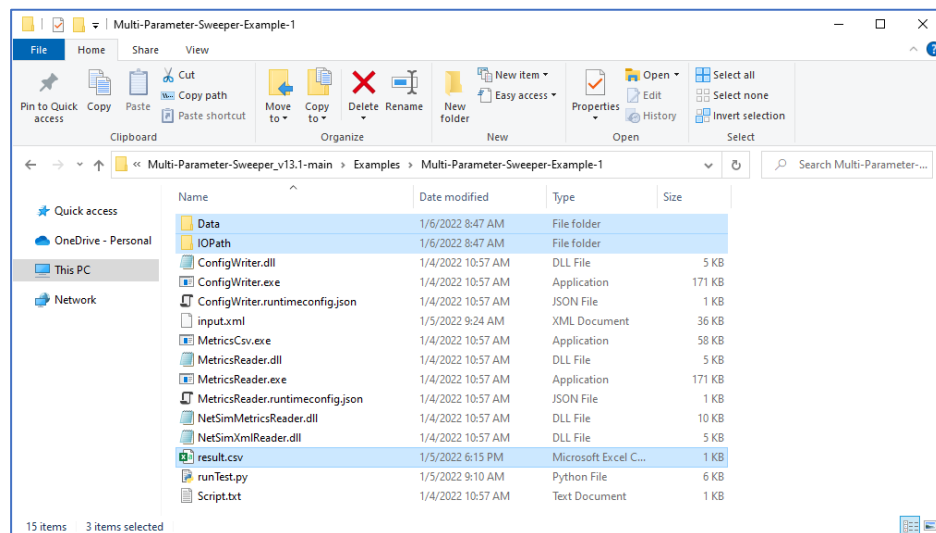

Figure 22: After Simulation Multi-Parameter-Sweeping folder contains output files like result.csv, Data etc

- Data:** Contains multiple folders corresponding to each simulation run, with its name including the value of the parameters in that iteration. The output folders will be created inside folder with name in the format Year-Month-Day-Hours-Minutes-Seconds.

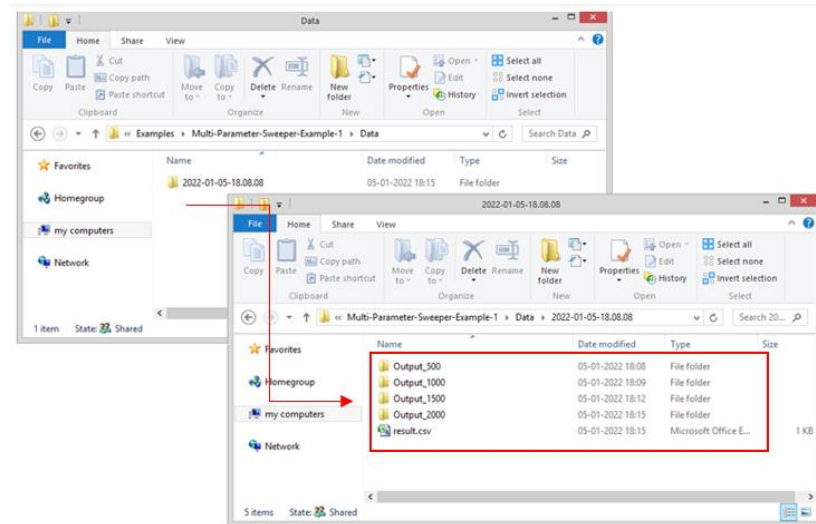

Figure 23: Based on distance Configuration.netsim files created in output folder

- Each folder contains the all the output files associated with the simulation run.

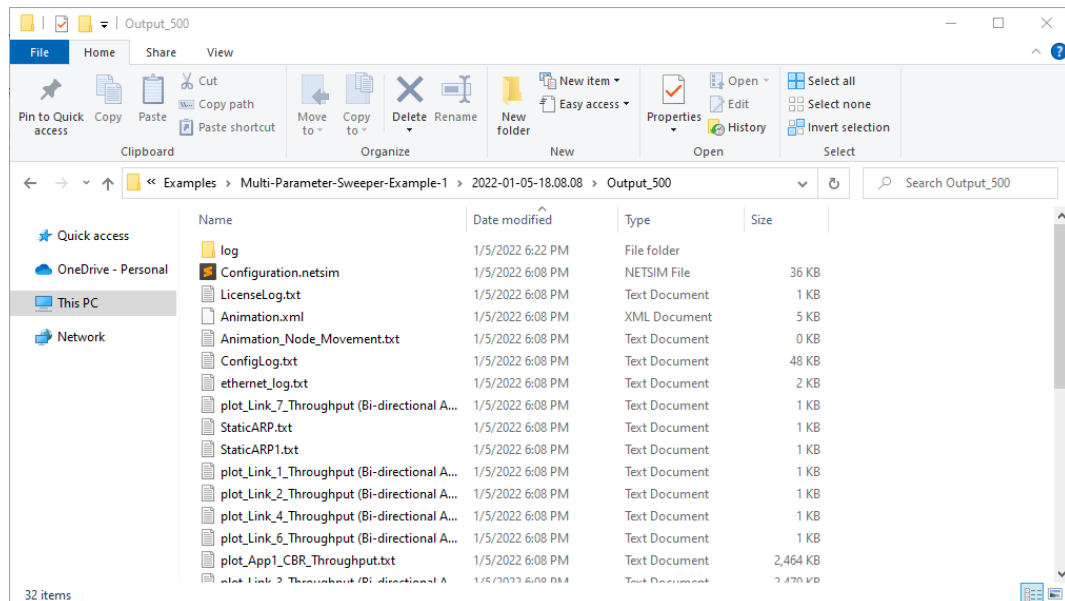

Figure 24: Each folder contains the all the output files

- **IOPath:** Used for storing the Configuration.netsim file and the simulation files generated during each simulation run.
- **Result.csv:** This is the output log which contains the parameter varied during each simulation run and the output parameter associated with each run.

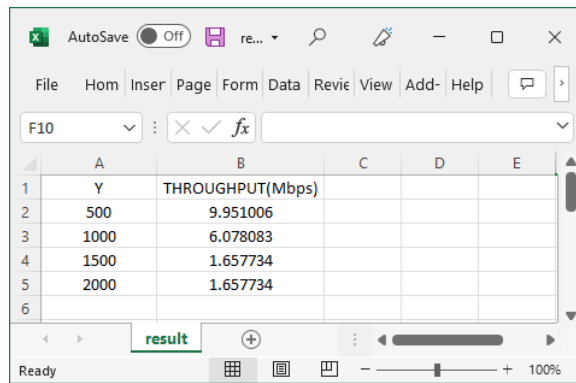

Figure 25: Distance Vs. Throughput obtained in result.csv

Varying multiple network parameters

In order to vary multiple network parameters during the multi-parameter sweep process each parameter in the input.xml file can be modified as {0},{1},{2},{3},...{n} respectively.

Logging multiple output parameters

Each output parameter that is to be logged should be part of the Script.txt file. However, the Script.txt file should contain only the details of one output parameter during the call to MetricsReader.exe.

To log multiple parameters, multiple script files can be used. If n output parameters are to be logged, then there can be script1.txt, script2.txt, script.txt in the sweeper folder.

For Example, there can be two Script files as shown below:

Name	Date modified	Type	Size
Data	05-06-2021 19:52	File folder	
IOPath	05-06-2021 19:52	File folder	
ConfigWriter.dll	10-04-2021 23:20	Application exten...	5 KB
ConfigWriter.exe	10-04-2021 23:20	Application	171 KB
ConfigWriter.runtimeconfig.json	10-04-2021 23:20	JSON File	1 KB
input.xml	05-06-2021 15:48	XML Document	35 KB
MetricsReader.dll	10-04-2021 23:20	Application exten...	5 KB
MetricsReader.exe	10-04-2021 23:20	Application	171 KB
MetricsReader.runtimeconfig.json	10-04-2021 23:20	JSON File	1 KB
NetSimMetricsReader.dll	10-04-2021 23:20	Application exten...	10 KB
NetSimXmlReader.dll	10-04-2021 23:20	Application exten...	5 KB
result.csv	05-06-2021 19:52	Microsoft Excel C...	1 KB
runTest.py	05-06-2021 16:48	Python File	5 KB
Script1.txt	10-04-2021 23:20	Text Document	1 KB
Script2.txt	10-04-2021 23:20	Text Document	1 KB

Figure 26: Multiple output parameters

Example 2: Modifying multiple input parameters and logging multiple output parameter

1. Consider the following network 5G network scenario in NetSim, comprising of a Wired Node, Router, gNB and a UE.

Figure 27: Network Scenario

2. Properties configured in the LTE_NR interface of the gNB is shown in the table below:

Interface(5G_RAN) Properties	
Tx_Power(dBM)	40
Tx_Antenna_Count	8
Rx_Antenna_Count	4
CA_Type	Single Band
CA_Configuration	n78
CA_Count	1
Numerology	0
Channel Bandwidth (MHz)	10
PRB Count	52
MCS Table	QAM64
CQI Table	Table 1
X_Overhead	XOH0
DL UL Ratio	4:1
Outdoor Scenario	Rural Macro
LOS Mode	Standard
Wireless Link Properties	
Channel Characteristics	No_Pathloss
Wired Link Properties	
Link Speed (Mbps)	10000
BER	0
Propagation Delay (µs)	0
Application Properties	

Packet Size (Byte)	1460
Inter Arrival Time (μs)	166
Generation Rate (Mbps)	100
Transport Control	UDP
Start Time (s)	1
QoS	BE
Simulation Parameters	
Simulation Time (s)	1.1

Table 1: gNB Properties

- Traffic is generated at a rate of 70 Mbps and upon running simulation, the throughput achieved is 59.95 Mbps.
- We now find the max throughput for each possible bandwidth; Tx Antenna count and Rx Antenna count combination varying the generation rate based accordingly.
- Two more parameters to be taken care include, the PRB Count and Guard Band (KHz) which vary with respect to the bandwidth.

Input Variables	Value Range
Channel Bandwidth (MHz)	10,15,20,25,30,40,50
Tx_Antenna_Count	1,2,4,8,16,32,64,128
Rx_Antenna_Count	1,2,4,8,16
PRB Count	52,79,106,133,160,216,270
Guard Band (KHz)	312.5,382.5,452.5,522.5,592.5,552.5,692.5
Reference Inter Arrival Time (Microseconds)	166
Reference Bandwidth	10
Reference DL MIMO Layer Count	2

Table 2: Input variable values

- Inter Arrival Time for each case is calculated based on the Reference IAT Bandwidth and DL MIMO Layer Count as shown below:

$$Inter\ Arrival\ Time\ (Micro\ Seconds) = \frac{Ref\ IAT}{\left(\frac{Curr\ BW}{Ref\ BW}\right) * \left(\frac{Curr\ DL\ MIMO\ Count}{Ref\ DL\ MIMO\ Count}\right)}$$

For E.g. In case of Bandwidth of 20 MHz and DL MIMO Count of 4 inter arrival time is

$$\text{Inter Arrival Time (Micro Seconds)} = \frac{166}{\left(\frac{20}{10}\right) * \left(\frac{4}{2}\right)} = 41.5 \text{ Mbps}$$

7. The network scenario is saved and the content of the Configuration.netsim file is copied to the Multi-Parameter-Sweeper directory and renamed as input.xml.
8. Refer to the Example 2 directory which is part of the project folder (Multi-Parameter-Sweeper_v13.1\Examples\Multi-Parameter-Sweeper-Example-2).

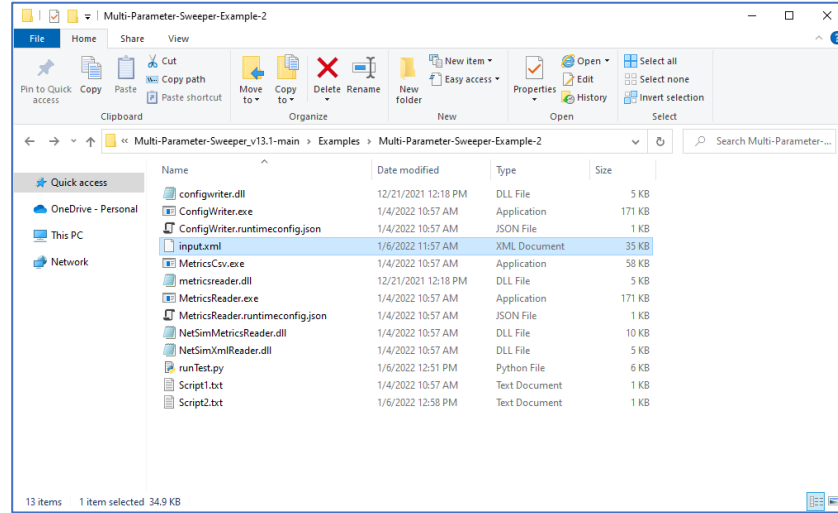

Figure 28: Renamed Configuration.netsim to input.xml and pasted in Multi-Parameter-Sweeper directory

9. In the Input.xml file the value of the input variables are modified as shown in the table below:

Input Variables	
Channel Bandwidth (MHz)	{0}
Tx Antenna Count	{1}
Rx Antenna Count	{2}
Inter Arrival Time (Microseconds)	{3}
PRB Count	{4}
Guard Band (KHz)	{5}

Table 3: Variables are modified to the input.xml file

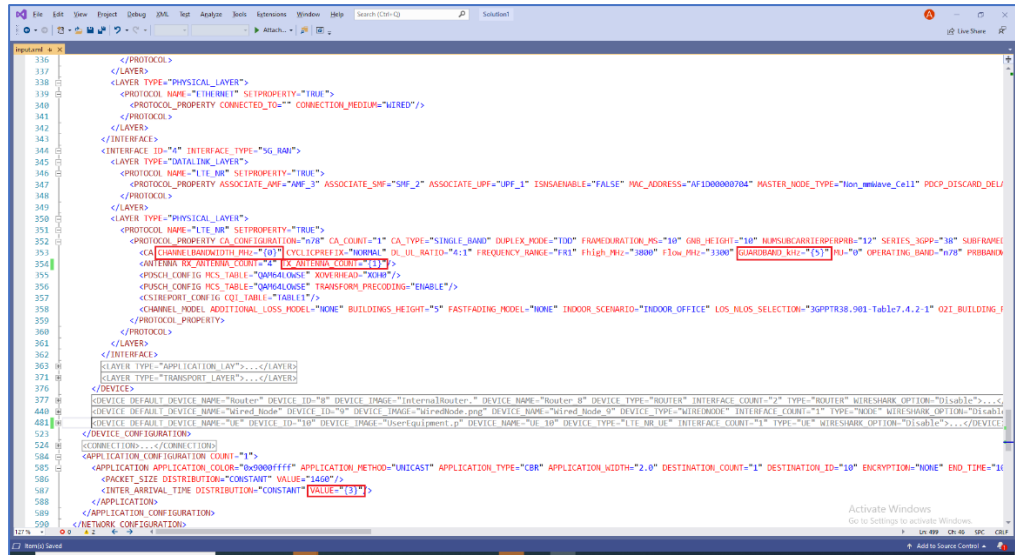

Figure 29: The above table 3 Variables are modified in input.xml file

- The python script runTest.py is modified to run simulation for all possible combinations of Bandwidth and Tx Antenna Count and Rx Antenna Count with the respective values of Guard Band, PRB Count and the IAT that is calculated.

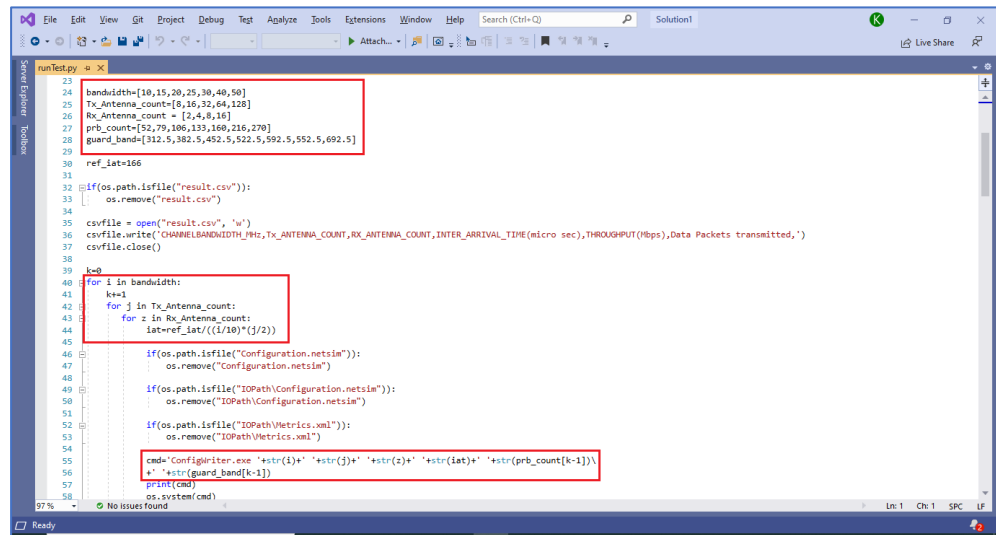

Figure 30: Modified runTest.py based on input parameter

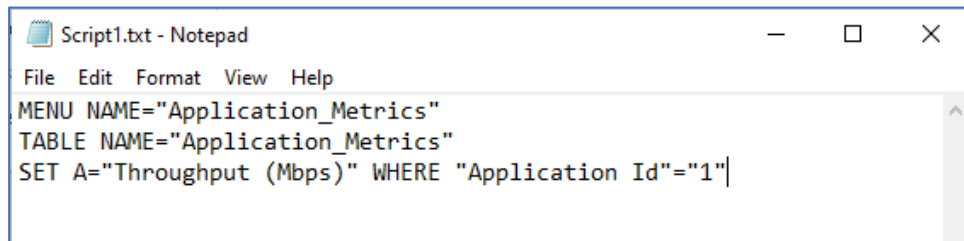

- Multiple parameters are read from the Metrics.xml file and logged in the results.csv file along with the input parameters such as CHANNELBANDWIDTH_MHz, TX_ANTENNA_COUNT, RX_ANTENNA_COUNT, INTER_ARRIVAL_TIME (micro sec).

Output Parameters
Throughput (Mbps)
Data Packets transmitted

Table 4: User need to modify these two parameters in Script files

12. Two script text files namely Script1.txt and Script2.txt are created with information to read each of the parameters from the Metrics.xml file. The variable OUTPUT_PARAM_COUNT is set to 2 as per the number of Script files.

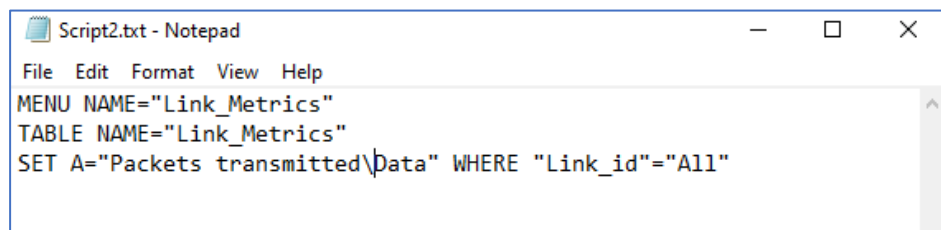

Script1.txt

A screenshot of a Notepad window titled "Script1.txt - Notepad". The window contains the following text:

```
File Edit Format View Help
MENU NAME="Application_Metrics"
TABLE NAME="Application_Metrics"
SET A="Throughput (Mbps)" WHERE "Application Id"="1"
```

Figure 31: The application throughput is to be logged for each simulation modified in Script1.txt

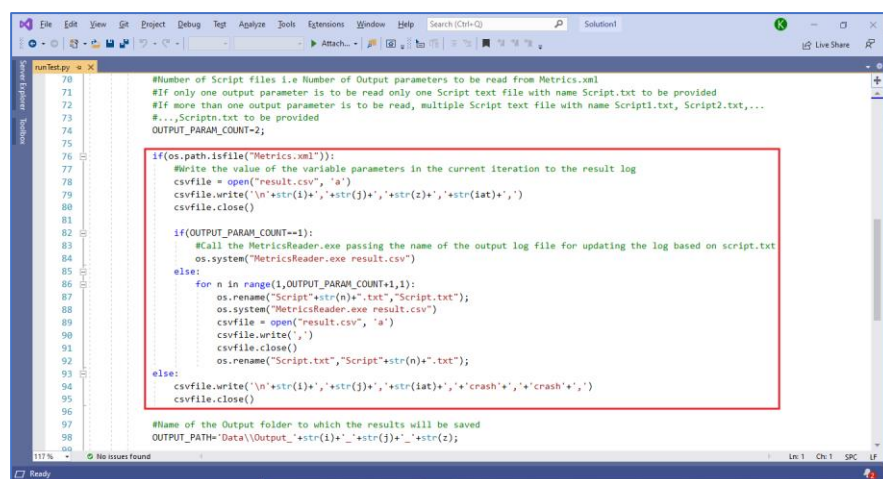

Script2.txt

A screenshot of a Notepad window titled "Script2.txt - Notepad". The window contains the following text:

```
File Edit Format View Help
MENU NAME="Link_Metrics"
TABLE NAME="Link_Metrics"
SET A="Packets transmitted\Data" WHERE "Link_id"="All"
```

Figure 32: The Data Packets transmitted is to be logged for each simulation modified in Script2.txt

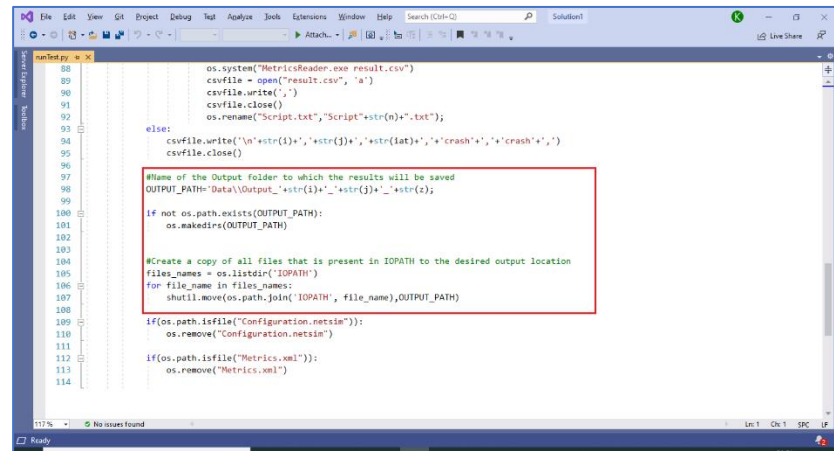

13. In the python script runTest.py, MetricsReader is called to log each parameter specified in the script text files separating the entries with a comma (","). If simulation crashes, without generating the output Metrics.xml, then "crash" message is written to the log for each output parameter. The input parameters that were varied during each simulation run are also logged in the results.csv file.

A screenshot of a Visual Studio Code editor showing the runTest.py file. The code is as follows:

```
70 #Number of Script files i.e Number of Output parameters to be read from Metrics.xml
71 #If only one output parameter is to be read only one Script text file with name Script.txt to be provided
72 #If more than one output parameter is to be read, multiple Script text file with name Script1.txt, Script2.txt,...
73 #...Scriptn.txt to be provided
74 OUTPUT_PARAM_COUNT=2;
75
76 if(os.path.isfile("Metrics.xml")):
77     #Write the value of the variable parameters in the current iteration to the result log
78     csvfile = open("result.csv", 'a')
79     csvfile.write('\n'+str(i)+'_'+str(j)+'_'+str(z)+'_'+str(iat)+'\n')
80     csvfile.close()
81
82 if(OUTPUT_PARAM_COUNT==1):
83     #Call the MetricsReader.exe passing the name of the output log file for updating the log based on script.txt
84     os.system("MetricsReader.exe result.csv")
85 else:
86     for n in range(1,OUTPUT_PARAM_COUNT+1,1):
87         os.rename("Script"+str(n)+".txt", "Script.txt");
88         os.system("MetricsReader.exe result.csv")
89         csvfile = open("result.csv", 'a')
90         csvfile.write(',')
91         csvfile.close()
92         os.rename("Script.txt", "Script"+str(n)+".txt");
93     else:
94         csvfile.write('\n'+str(i)+'_'+str(j)+'_'+str(iat)+'_'+str(z)+'_'+str(iat)+'_'+str(z)+'\n')
95         csvfile.close()
96
97 #Name of the Output folder to which the results will be saved
98 OUTPUT_PATH="Data\\Output_"+str(i)+"_"+str(j)+"_"+str(z);
```

Figure 33: Modify python script runTest.py file

14. The simulation Configuration file and all the output files associated with each simulation run is saved to folders with name including the bandwidth and DL MIMO count values that were used during each simulation run.

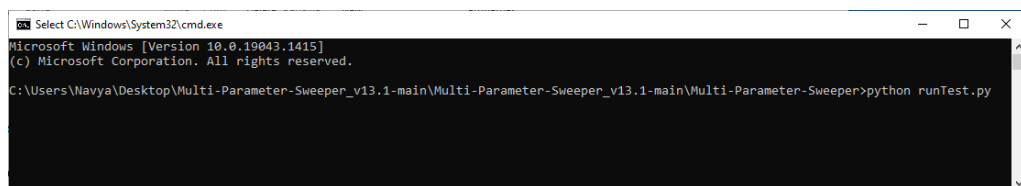

```
88 os.system("MetricsReader.exe result.csv")
89 csvfile = open("result.csv", 'a')
90 csvfile.write(',')
91 csvfile.close()
92 os.rename("Script.txt", "Script"+str(n)+".txt");
93
94 else:
95     csvfile.write('\n'+str(i)+'_'+str(j)+'_'+str(iat)+'_'+str('crash'+s)+'_'+str('s'+s))
96     csvfile.close()
97
98 #Name of the Output folder to which the results will be saved
99 OUTPUT_PATH="Data\\Output_"+str(i)+'_'+str(j)+'_'+str(z);
100
101 if not os.path.exists(OUTPUT_PATH):
102     os.makedirs(OUTPUT_PATH)
103
104 #Create a copy of all files that is present in IOPATH to the desired output location
105 files_names = os.listdir("IOPATH")
106 for file_name in files_names:
107     shutil.move(os.path.join("IOPATH", file_name), OUTPUT_PATH)
108
109 if(os.path.isfile("Configuration.netsim")):

Figure 34: Modify python script runTest.py file

15. Multi-Parameter Sweeping process is started by opening command prompt in the directory of the Multi-Parameter-Sweeping project and starting the python script as shown below:

Python Script:

```
Select C:\Windows\System32\cmd.exe
Microsoft Windows [Version 10.0.19043.1415]
(c) Microsoft Corporation. All rights reserved.

C:\Users\Navya\Desktop\Multi-Parameter-Sweeper_v13.1-main\Multi-Parameter-Sweeper_v13.1-main\Multi-Parameter-Sweeper>python runTest.py
```

Figure 35: Running Python Script using cmd Prompt

This starts the Multi-Parameter-Sweeping process which runs NetSim simulations iteratively for different combinations of input parameters.

At the end of the process the Multi-Parameter-Sweeping folder will have the following file and folders created:

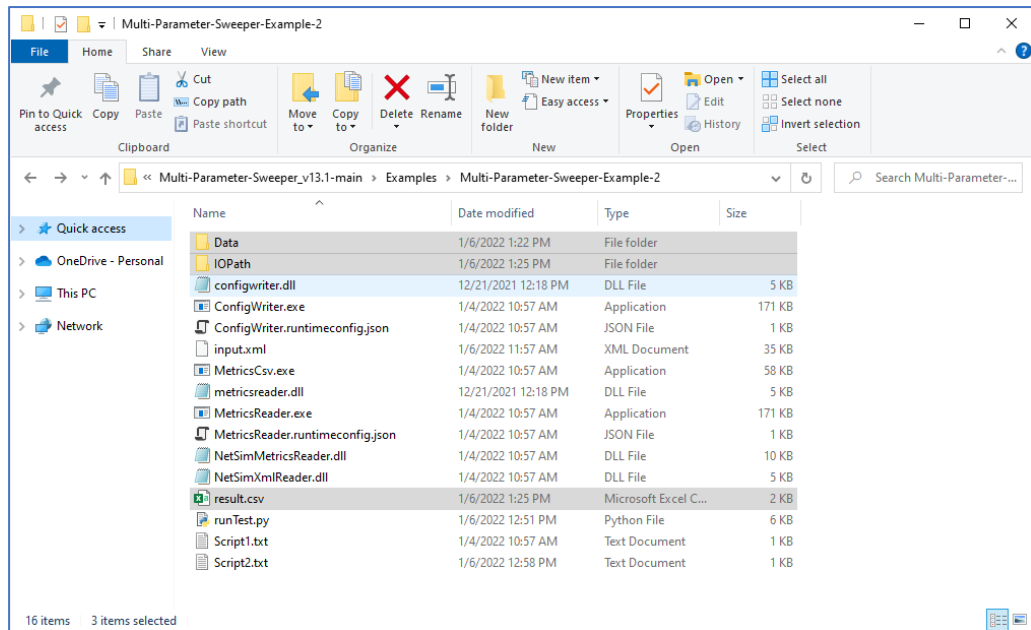

Figure 36: After Simulation Multi-Parameter-Sweeping folder contains output files like result.csv, Data etc

16. **Data:** The Data directory contains multiple output folders with the output files associated with each simulation run.

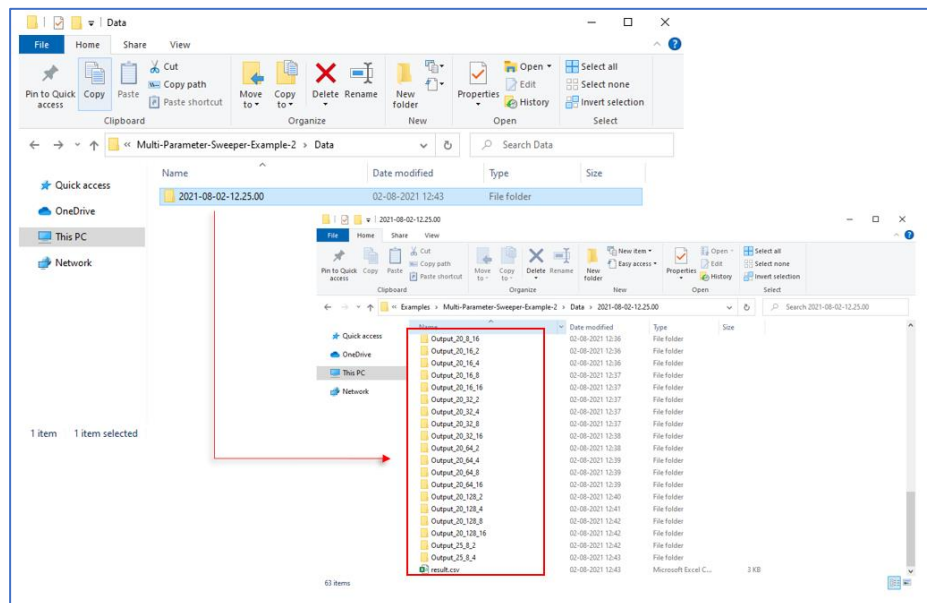

Figure 37: Based on input parameter Configuration.netsim and other files created in output folder

17. **IOPath:** Used for storing the Configuration.netsim file and the simulation files generated during each simulation run.
18. **Result.csv:** This is the output log which contains the parameter varied during each simulation run and the output parameter associated with each run.
